Julian Robert Ullrich

## Abstract

Deep Reinforcement Learning and policy gradient methods majorly contributed to the most recent advances in the field of Artificial Intelligence. These Methods enabled machines to surpass human performance for Atari console games (Mnih et al., [2015](#)), boardgames like Chess, Shogi (Silver et al., [2017a](#)) or Go (Silver et al., [2017b](#)) and most recently even complex team-based computer games (OpenAI, [2018](#)).

As environments grow in complexity, their simulation requires more computational resources. Sample efficiency has therefore become an important aspect of reinforcement learning.

The goal of this thesis is the implementation and evaluation of the "Actor-Critic with Experience Replay"(ACER) algorithm proposed by Wang et al., [2016](#) on the Atari console games.
